SUMMARY

During the time frame of this report, your cybersecurity platform **analyzed 69,181 events** from **14 entities** on your network.

Of those events, there were **3 signals detected** through automated and human analysis. Security analysts manually **investigated 1 signal** that was suspicious in nature. That investigation led to **1 incident report**, which required remediation of compromised entities by your security team. This defense strategy continues to reduce your risk, which maximizes your security and minimizes cyberattack damage to your business.

GLOBAL THREATS

- RMM
- SCREENCONNECT

This month, one tool dominated alerts: ScreenConnect. Trial-version services spun up on endpoints, binaries were staged from temp folders, and service commands fired from domains outside legitimate hosted instances, with several beaconing to known-malicious servers. To stay ahead and limit the attack surface, inventory remote access tools, and watch for trial or suspicious relay servers. Spotting that first spin-up early gives your team time to remove it before it takes hold.

RANSOMWARE CANARIES

During this time frame, your cybersecurity team monitored **15 canary files deployed** on Windows endpoints, which acted as early warning signals for ransomware on your network.

Like the old canary in the coal mine, Ransomware Canaries enable faster and earlier detection of potential ransomware incidents. When deployed, small lightweight files are placed on all protected endpoints—and if those files are modified or changed in any way, an investigation is conducted.

CANARIES IN YOUR MINE

Ransomware Incidents Reported

across **2** endpoints

RANSOMWARE IN THE NEWS

In the past 45 days, ransomware attacks have remained high, despite law enforcement crackdowns. The LockBit group is apparently reorganizing and has released an updated version called LockBit 5.0, which focuses on selective targets. Other mid-tier groups are stepping in where major RaaS shutdowns occurred, creating a more divided cybercrime environment. Healthcare and manufacturing sectors are still key targets, with many incidents involving supply-chain footholds and unmanaged external services. While improved defenses have made it harder for attackers to encrypt data, the demands for money and operational disruptions are still increasing. Researchers and competing ransomware groups are sharing information publicly, which may have led to a member of a ransomware group, Rey from SLISH, being exposed by an infostealer self-infection. As we approach the holidays, ransomware groups like CIOp, LockBit variants, Anubis, and INC continue to victimize people and organizations.

MANAGED ITDR

During this time frame, your cybersecurity platform **analyzed 69,162 Microsoft 365 events** to identify any that could be potential threats to your Microsoft 365 users or environment.

Of those events, there were **3 Microsoft 365 signals detected** through automated and human analysis. Security analysts manually **investigated 1 signal** that was suspicious in nature. That investigation led to **1 Microsoft 365 incident report**, which required remediation of compromised users by your security team.

MICROSOFT 365 EVENT TRIAGE

WHAT IS MANAGED ITDR?

As an integral and widespread productivity suite, Microsoft 365 is a high-profile target for threat actors. Managed ITDR can detect anomalous logins, suspicious email rules, and other hacker tradecraft within Microsoft 365.

When a potential attack is detected, a security analyst reviews the activity, and an incident report with remediation steps is actioned by your security team.

MANAGED SIEM

During this time frame, your cybersecurity platform **ingested 63,387 logs** using Smart Filtering to reduce noise **from originally 63,394 logs** in order to identify any that could be potential threats to your organization.

From the ingested logs, there were **0 SIEM signals detected**.

SIEM EVENT TRIAGE

WHAT IS SIEM?

Security Information and Event Management (SIEM) aggregates and analyzes security data from various sources across an organization's IT infrastructure. It enables real-time monitoring, threat detection and response by identifying patterns, anomalies and alerts within the data.

Analysts use the consolidated information from SIEM to assess risks, correlate events and respond quickly to incidents.

INCIDENT SUMMARY

During this time frame, your security team responded to a total of **1 incident report** . This page provides summary metrics, broken down by incident severity, product, most common antivirus signals reported, and most targeted entities."
